

**flow-captor 4205 + 4053.31**

Probably none of the modern trains like the ICE can be operated without "high-performance electronics".

It is essential that those electronics have to work reliably. Larger components are subject to strong self-heating and therefore have to be cooled.

This is why our **flow-captors** are used. They monitor the oil cooling circuits of power converters and transformers, for example, and thus help to prevent damage to people and materials.
